

Guidance for Tagging on AWS

1 (CF23 - S1) Define a tagging strategy: decide what the mandatory tags are, your tagging policy, and your tagging standards. Stakeholders across the company provide the information required to the Cloud team to standardize tagging.

2 (CF23 - S2) Create tag policies in **AWS Organizations** and attach them to the relevant organizational units (OUs) and accounts to generate resource compliance reports and understand how resources are tagged in your environment.

3 (CF23 - S2) **AWS Systems Manager** can help you tag resources through automations across your AWS environment. You can also use resource groups to bulk tag your resources across your environment.

4 (CF23 - S3) Within your operations account, create a dashboard that can display the metadata assigned to your resources and act as a remediation mechanism.
